

Maths Modelling Challenge: Years 7 - 12

Student Handout

Scenario: Social Media - Carbon Footprint

Posting a selfie on a social media platform, sending that selfie over a network and then storing the data on a server has an associated CO₂ emission of which many social media users remain unaware. In fact, streaming and data services are one of the largest producers of CO₂ emissions after transport and animal agriculture.

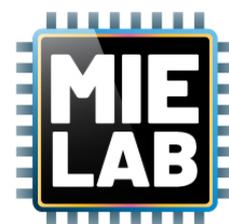

Climate change is a key issue of the 21st Century. Many governments, industry and the individual are taking responsibility to reduce the negative impacts that human-related activities are having on the environment. An environmental research team based at USC has asked your group to help raise awareness around the alarming hidden cost posting selfies has in its contribution to CO₂ emissions. The research team has asked you to help them calculate the environmental impact of posting selfies, as well as putting this into context to raise awareness of social media users carbon footprint associated with their daily social media actions.

There are many ways to approach this problem but a good place to start is to consider a selfie as data and then convert data MB into electricity efficiency CO₂/kWh.

(Students can use their own mobile phone WhatsApp data size. Alternatively, they can google data sizes for WhatsApp group chats. Student access to mobile phone is at discretion of school.)

Key points the research team have asked you to address are:

- How much of Australia's annual CO₂ emissions is generated from Australian WhatsApp users posting a single selfie per day on the social media platform?
- What area of trees are needed to absorb this amount of CO₂?
- How can you help? If you and your social network group posted 10% less data content to your group chat what would the reduction in CO₂ emission be over a year?
- Can you put this into context in terms of amount of natural CO₂ sinks (such as forest, coral reefs, seaweed forest etc) freed up to absorb CO₂ emissions from other sources?

USEFUL RESOURCES

There are many ways to approach this problem and many sources for reference. Below is a list of useful links and hints that provide some background reading and may aid in your approach to the problem. These can all be accessed without special licenses to journals.

The environmental cost of being selfish

<https://www.core-econ.org/wp-content/uploads/2019/07/Data-competition-selfie.pdf>

Moving data through a network

There are various sources that reference moving data through a network and little consistency in the analysis; some include hard-drive activity and storage, and others do not. It's difficult to tell where the number really lies!

Some sources provide values of between 3 to 7 kWh/GB for transporting and storing data in the cloud therefore, the Costenaro and Duer 2012 value of 5 kWh/GB was chosen. However, if you prefer to use other values here are some refs as well as Costenaro and Duer 2012.

Helpful Hint - Conversion of a selfie into CO₂ emissions

The average electricity efficiency for sending and storing data in Australia can be modelled in gCO₂/kWh. Then convert data into kWh using a conversion rate from the above literature with units kWh/GB

For example:

1 selfie = 2MB = 0.002GB

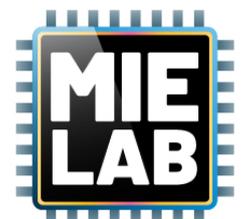

1 selfie when uploaded to WhatsApp gets down sampled to ~100KB = 0.0001GB

in terms of electricity 1 selfie = 0.0001GB x conversion rate kWh/GB = XX kWh

CO₂ emission of 1 selfie = gCO₂/kWh x kWh = XX gCO₂

Helpful Hint - Finding your own data consumption

You can view the data usage of a single message/photo or entire chat group by looking at the settings of the social media account on your phone. As an example to view data used in WhatsApp navigate to Settings/Data and Storage Usage/Network Usage or Storage Usage.

Scenario: Social Media - Carbon Footprint

INDEX

~: symbol for approximately

Average electricity efficiency: Is the how efficient a network is at sending data and is quoted in grams of CO₂ per kilowatt hour (gCO₂/kWh) and defines the amount of CO₂ emitted per unit of electricity. Lower values are more environmentally friendly.

CO₂: carbon dioxide

Carbon absorption rate of trees: A process whereby carbon is removed from the atmosphere and stored long-term in trees, roots and soil.

Cloud: using a network hosted on the internet to store, manage and process data rather than a personal computer.

Greenhouse gas emission: The release of harmful gases into our environment from transport, industry and other human activity.

GB: gigabyte is a measurement of data storage for computers, tablets, smartphones, and other computing devices. 1 GB = 1000MB or 230 bytes.

gCO₂/kWh: grams of carbon dioxide per kilowatt hour

kWh: Kilowatt hour is a measure of electrical energy equivalent to a power consumption of one thousand watts for one hour.

KB: kilobytes is a measurement or unit of memory or data storage for computers, tablets, smartphones, and other computing devices that is equal to 1024 (2¹⁰) bytes. Due to convenience and because 1024 is approximately 1000 the prefix kilo is used.

MB: megabyte is a measurement of data storage for computers, tablets, smartphones, and other computing devices. 1MB = 1000KB or 220 bytes.
